

Unleash Your PowerBuilder Assets!

Dear Manager!

Business processes in your organization are important assets, which create differentiation from competitors and allow your organization to exist.

These assets are often locked inside old and limited legacy systems and development environments. There are many limitations, and their impact on the organization's capabilities to compete in a changing market is critical.

- * Difficulty finding professionals to maintain and support the system.
- * Difficulty to simple link to modern systems and software packages.
- * Difficulty in a natural exposure of business logic for reuse in other enterprise systems.

We in MainTrend Software believe, that implementation of modernization based on our experience, tools and our developed methodology, will allow your organization to make the transition at approximately 65% savings compared to alternative cost - thanks to our automatic conversion tools. The new system architecture will turn into a web based Java or .NET system.

No matter how complex or big the existing system is - we can handle it.

We successfully implemented complex migration projects around the world, and we believe that we can serve you well in this task.

Additionally, it's worth to take into consideration the uncertain future of the existing legacy development environment. Any organization operating in this system environment must think about the future. Migration is the safe route to transit into modern environment while maintaining the organization's assets and business logic. Using this method, the organization utilizes modern environmental benefits in relatively lower price than complete replacement and rewriting of the system.

When to consider modernization?

- There is a business system, based on a platform with uncertain future.
- There is difficulty in finding competent programmers familiar with the legacy development platform.
- System support and maintenance become difficult, expensive and slow.
- Your organization considers SOA and business logic backwards conservation strategy.
- You wish to migrate into a new environment without losing past massive investment in organizational business logic.
- You wish to turn computing expenses into business results rather than just core systems support.
